Job Market Paper

Does Distance from Home Matter in Prison? Effects on Visitation and Recidivism

This paper studies how the distance between prison and an incarcerated individuals home affects their likelihood of recidivism. Leveraging a unique dataset covering more than 20,000 incarcerated individuals and over 200,000 prison visits, I exploit quasi-random variation in home-to-prison distance generated by facility assignment rules. I find that a 100-mile increase in placement distance raises prison readmission within 3 years by 3.5 percent. This effect is driven by a reduction in visitation, with individuals placed farther from home receiving significantly less visits. While social support is theorized to reduce recidivism, there is limited causal evidence on how maintaining these connections through visitation during incarceration affects recidivism. To address this, I use distance as an instrument for visitation, and find that an additional visit per month lowers the likelihood of re-incarceration by roughly 14 percent within one year post-release and 7 percent within three years post-release. I also show that an additional visit per month shortens the fraction of sentence served by one percent and reduces housing instability by 12 percent, the former consistent with a reduction in misconduct and the latter an important

mechanism for successful post-release outcomes. Counterfactual estimates suggest assigning individuals closer to home could reduce recidivism by 2 to 4 percent.

Working Papers

An evaluation of Crisis-Intervention Team (CIT) training

Police officers in the United States are most often the first responders to a mental health crisis. The most popular training method for these responses among US police departments is crisis-intervention team (CIT) training. This paper provides the first estimates of the causal effect of CIT training on a police officer's propensity to use force and make an arrest. I implement a difference-in-differences framework using future trainees as controls to compare officer use of force and arrest of trained officers to those of untrained officers. I do not find a statistically significant effect of CIT training on either use of force or propensity to arrest.
